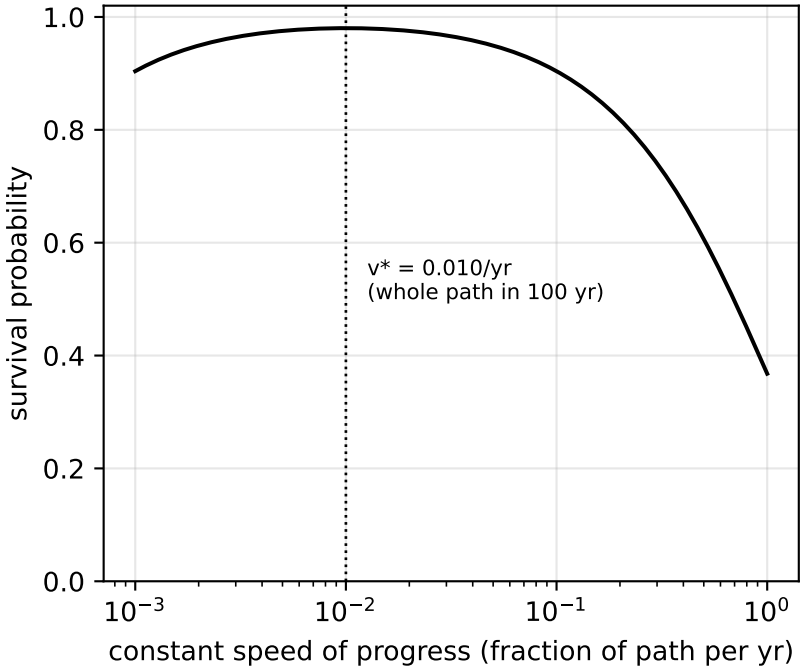
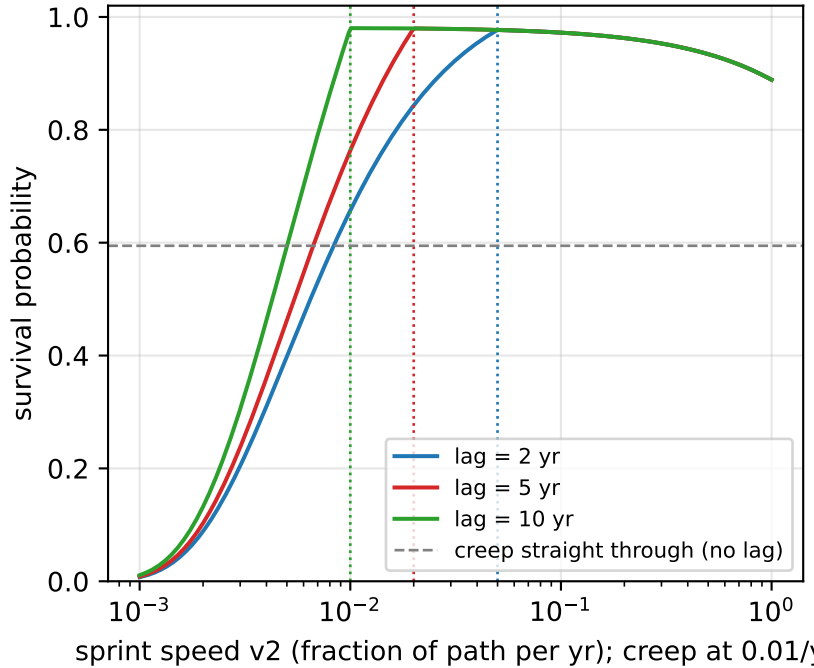
(a) Watchers infer from state: sprint inside the lag
inference lag = 2 yr
inference lag = 5 yr
inference lag = 10 yr
survival probability
duration of final sprint (yr)



(b) Watchers infer from rate: an optimal pace
v* = 0.010/yr
(whole path in 100 yr)
survival probability
constant speed of progress (fraction of path per yr)



(c) Mixed: slowest sprint that fits the lag
lag = 2 yr
lag = 5 yr
lag = 10 yr
creep straight through (no lag)
survival probability
sprint speed v2 (fraction of path per yr); creep at 0.01/yr
